CodeWarrior™ Software Dongle

The USB Dongle is a small device that plugs into a USB port on a host computer to provide an ID that is used in licensing the use of CodeWarrior™ software. Freescale provides them as a licensing option for our customers. The dongle allows for a single, specific node-locked copy of a given CodeWarrior™software suite to be used with any given computer system by attaching the dongle to their computer's USB port. Proper operation of the desired CodeWarrior™ software product does require a valid license on the USB dongle.

32-Bit

The TriCore™ is the first unified, single-core, 32-bit microcontroller-DSP architecture optimized for real-time embedded systems. The TriCore Instruction Set Architecture (ISA) combines the real-time capability of a microcontroller, the computational power of a DSP, and the high performance/price features of a RISC load/store architecture, in a compact re-programmable core.

infineon **NEW!** SmartLEWIS™ Microcontrollers

Digi-Reel® RoHS

The SmartLEWIS™ MCU family comprises an ASK/FSK multiband transmitter for the sub 1GHz ISM frequency bands with an embedded 8051 microcontroller as base functionality. Additionally, the highly integrated single chip family has internal sensors and optional peripheral functions like an analog to digital converter (ADC) and a LF receiver on chip. The high efficiency power amplifier and an advanced power control system make the PMA51xx family ideal for battery operated applications where low current consumption is necessary. The pin-compatible product family requires only a few external components and is the basis for flexible wireless control transmitter platforms enabling applications for different frequency bands, output power levels and feature sets based on only one design - just through different mounting options. Depending on the product variant, PMA51xx offers an embedded multi-channel 10-bit analog to digital converter with flexible high-gain settings as interface for a broad variety of analog sensors and an integrated 125kHz LF receiver. The LF receiver enables wireless wake-up in battery operated applications with ultra-long lifetime or even contactless configuration of the device.

Emulator Development Tools

Analog Devices cost-effective Universal Serial Bus (USB)-based emulator and High performance (HP) Universal Serial Bus (USB)-based emulator each provide an easy, portable, non-intrusive, target-based debugging solution for Analog Devices JTAG processors and DSPs. These powerful USB-based emulators perform a wide range of emulation functions, including single-step and full speed execution with pre-defined breakpoints, and viewing and/or altering of register and memory contents. With the ability to automatically detect and support multiple I/O voltages, the USB and HP USB emulators enable users to communicate with all of the Analog Devices JTAG processors and DSPs using either a full speed USB 1.1 or high speed USB 2.0 port on the host PC.

Analog Devices Blackfin emulator, ADZS-ICE-100B, is an easy, portable, nonintrusive, target-based debugging solution. The emulator performs a wide range of emulation functions, including single-step and full-speed execution with predefined breakpoints, and viewing and/or altering of register and memory contents. The Blackfin emulator enables users to communicate with Analog Devices Blackfin processors using a high speed USB 2.0 port on the host PC.

Features: All emulators require VisualDSP++ software for the corresponding processor.

Megapixel

Megapixel-resolution sensors combine the image quality of CCD technology with the compact size, adaptability, and ease-of-design of CMOS. CMOS-based technology can simplify camera designs compared to conventional CCD technology, thereby enabling designers to create smaller, high-performance applications with shorter development periods.

M16C Family

The M16C family offers the industry's broadcast multi-purpose microcontroller platform, with seamless code and pin compatibility – all the way from 8-bit ~ 32-bit functionality. A robust platform of 16/32-bit CISC microcontrollers with speeds from 16MHz ~ 64MHz, up to 512K on-chip flash memory, high ROM code efficiency, extensive EMI/EMS noise immunity and very low power consumption. It also features a broad choice of standard on-chip peripheral options and the highest pin-to-pin compatibility (up to 144 pins) in the industry.

Microcontrollers

R8C Tiny Series

The R8C 16-bit microcontrollers are small in size, yet big in performance and value. They excel for 8-bit embedded system applications that need low-cost devices and deliver high performance, yet save space with small, low-pin count packages. These microcontrollers for general purpose applications deliver up to 20MHz speed, up to 96K of on-chip flash memory, offer versatile peripherals, and are packaged with 80 pins or less. Based on the MC16 family of 16-bit microcontrollers, the R8C Tiny inherits the same features of high performance, ROM code efficiency, low power consumption, and low noise, while its instruction compatibility allows the use of existing M16C family software resources.

SuperH™ Family

SuperH is an embedded RISC developed for high performance, miniaturization and performance per power consumption (MIPS/W). Renesas is developing CPU cores for a wide range of applications and functions and have many products. These product lines include the series with SH-2 as the CPU core with on-chip large capacity flash memory and peripheral functions such as timer, serial and AD converter, and the series with SH-3 and SH-4 as the CPU core which enable high-speed data processing and come equipped with cache and MMU. Additionally, there is lineup of series with SH2-DSP and SH3-DSP as the CPU core, which have full DSP functions and an emphasis on multimedia processing and communications processing. Currently available series (products) also have lots of features such as low power mode, contributing to low power consumption and miniaturization for application hardware. Various versatile operating systems and development tools have been improved and, crucially, more efficient development can be achieved.

QSK62P Plus

The QSK62P Plus Quick Start Kit (QSK) is a low-cost development environment for evaluating the M16C/60 series of microcontrollers (MCU) and Renesas software development tools. The QSK62P Plus uses the M30620FC MCU, which belongs to the M16C/60P group of the M16C/60 series. The M30620FC MCU has all of the on-chip peripheral functions of the M16C/30P group MCUs (plus some more), so it can be considered a "superset" suitable for evaluating the M16C/30P group as well. The kits come with a complete software development tool chain for Renesas MCUs, including the NC30WA C-compiler, assembler and linker; a "stripped down" E8 Emulator; and the High-performance Embedded Workshop (HEW), which consists of Integrated Development Environment (IDE), Graphical User Interface (GUI) and Software Debugger.

The QSK62P Plus boards feature on-board in-circuit debugging and programming support (ICD), eliminating the need for an external ICD unit. All that is required for in-circuit debugging and programming with the QSK62P Plus is a USB connection to a PC running the included development tool software.

CDB4265 Evaluation Board

The CDB4265 evaluation board is an excellent means for evaluating the CS4265 CODEC. System timing for I^{2}S, Left-Justified and Right-Justified interface formats can be provided by the CS4265, the CS8416, or by a PCM I/O stake header with an external source connected. RCA phono jacks are provided for the CS4265 analog inputs and outputs. Digital data I/O is available via RCA phono or optical connectors to the CS8416 and CS4265. The Windows® software provides a GUI to make configuration of the CDB4265 easy. The software communicates through the PC's serial port to configure the control port registers so that all features of the CS4265 can be evaluated. The board may also be configured to accept external timing and data signals for operation in a user application during system development. **Features:** • Coaxial and Optical Connections for CS4265 S/PDIF Transmitter Output • CS8416 S/PDIF Digital Audio Receiver • Header for external PCM serial audio I/O • 3.3 V Logic Interface • Pre-defined Software Scripts • Windows Compatible Software Interface

Demonstration Boards

DB62 Demonstration Board for SA305EX

The DB62 is designed to demonstrate the capabilities of the SA305EX as a 3 phase brushless DC motor driver IC. The PWM inputs to the SA305 are controlled by an on-board microcontroller. The EVAL49 board is pre-wired for all required and recommended external components.

598-1394-ND (DB62) **$269.24**

DB63R Demonstration Board for SA57-IHZ

The DB63R is designed to demonstrate the capabilities of the SA57 DC brush motor driver IC. This fully assembled demonstration allows the user to directly control the speed and direction of the motor. An onboard circuit controls the direction and provides four quadrant PWM signals to control the power outputs of the SA57. LEDs provide feedback for motor control status and fault indications. Provisions on the DB63R allow the user to bypass the onboard control circuit and directly interface with the SA57 motor driver.

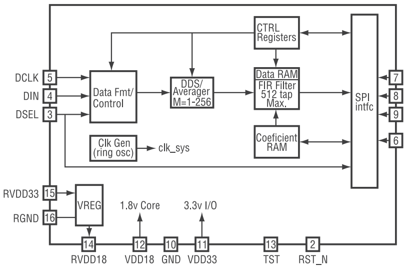
Programmable Digital Filters

The QF1D512 is a single channel, programmable digital filter designed for seamless insertion in the serial data path of a digital signal or used as an FIR coprossesor. The circuit shows the QF1D512 operating between an ADC and an MCU. The device can be programmed using the Quickfilter Design Software which supports most FIR digital filter configurations. The FIR filter has 512 taps capable of generating "brick wall" filters such as a low pass filter with a 1kHz cutoff frequency, 140dB of rejection, and a total transition band of only 10Hz. The filter can operate over a broad range of ADC data rates - from 10sps up to 500ksps and can support ADCs with resolutions ranging from 12 ~ 24 bits.



The QF4A512 Programmable Signal Converter is a 4-channel, signal conditioner and signal converter. Each channel can be individually programmed for the gain, anti-aliasing filter cutoff frequency, A ~ D sampling frequency, and unique filter requirements. This is accomplished with 4 separate high-precision 512-tap FIR filters. Quickfilter software has been created for rapid device configuration and filter design at performance levels unattainable with analog components.

Video Enhancement Processors

The EVD1000 Series of ICs are a single-chip solution providing sophisticated enhancement capabilities in a remarkably compact, easily-integrated package with no external memory or FPGAs required. The EVD1000 series features a convolution kernel with hundreds of pixels on a side. This means that when EVD enhances a pixel, more than 10,000 of its nearest neighbors are considered. By considering the spatial data in a large neighborhood centered around each pixel as it is being processed, a much larger range of spatial frequencies in the image is allowed. Packaged in a compact 128-pin TQFP (thin quad flatpack) case, these chips use about 1/4 square inch of circuit board real estate and can accept a wide array of digital data formats including YCrCb, RGB, and BT656. 10-bit data paths produce faithful results, and the device is also configurable for 8-bit applications.
